

## NAG C Library Function Document

### **nag\_prob\_non\_central\_students\_t (g01gbc)**

#### 1 Purpose

nag\_prob\_non\_central\_students\_t (g01gbc) returns the lower tail probability for the non-central Student's  $t$ -distribution.

#### 2 Specification

```
#include <nag.h>
#include <nagg01.h>

double nag_prob_non_central_students_t (double t, double df, double delta,
                                         double tol, Integer max_iter, NagError *fail)
```

#### 3 Description

The lower tail probability of the non-central Student's  $t$ -distribution with  $\nu$  degrees of freedom and non-centrality parameter  $\delta$ ,  $P(T \leq t : \nu; \delta)$  is defined by:

$$P(T \leq t : \nu; \delta) = C_\nu \int_0^\infty \left( \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\alpha u - \delta} e^{-x^2/2} dx \right) u^{\nu-1} e^{-u^2/2} du, \quad \nu > 0.0$$

with

$$C_\nu = \frac{1}{\Gamma(\frac{1}{2}\nu)2^{(\nu-2)/2}}, \quad \alpha = \frac{t}{\sqrt{\nu}}$$

The probability is computed in one of two ways,

- (a) when  $t = 0.0$ , the relationship to the normal is used

$$P(T \leq t : \nu; \delta) = \frac{1}{\sqrt{2\pi}} \int_\delta^\infty e^{-u^2/2} du;$$

- (b) otherwise the series expansion described in Amos (1964) (equation 9) is used. This involves the sums of confluent hypergeometric functions, the terms of which are computed using recurrence relationships.

#### 4 Parameters

- |  |              |
|--|--------------|
| 1: <b>t</b> – double   | <i>Input</i> |
| <i>On entry:</i> the deviate from the Student's $t$ -distribution with $\nu$ degrees of freedom, $t$ . |              |
| 2: <b>df</b> – double  | <i>Input</i> |
| <i>On entry:</i> the degrees of freedom of the Student's $t$ -distribution, $\nu$ .                    |              |
| <i>Constraint:</i> $\mathbf{df} \geq 1.0$ .  |              |
| 3: <b>delta</b> – double   | <i>Input</i> |
| <i>On entry:</i> the non-centrality parameter of the Students $t$ -distribution, $\delta$ .            |              |

4:	<b>tol</b> – double	<i>Input</i>
	<i>On entry:</i> the absolute accuracy required by the user in the results.	
	If nag_prob_non_central_students_t is entered with <b>tol</b> greater than or equal to 1.0 or less than $10 \times \text{machine precision}$ , then the value of $10 \times \text{machine precision}$ is used instead.	
5:	<b>max_iter</b> – Integer	<i>Input</i>
	<i>On entry:</i> the maximum number of terms that are used in each of the summations.	
	<i>Suggested value:</i> 100. See Section 6 for further comments.	
	<i>Constraint:</i> <b>max_iter</b> $\geq 1$ .	
6:	<b>fail</b> – NagError *	<i>Input/Output</i>
	The NAG error parameter (see the Essential Introduction).	

## 5 Error Indicators and Warnings

### NE\_REAL\_ARG\_LT

On entry, **df** must not be less than 1.0: **df** = <value>.

### NE\_INT\_ARG\_LT

On entry, **max\_iter** must not be less than 1: **max\_iter** = <value>.

### NE\_SERIES

One of the series has failed to converge with **df** = <value> and **max\_iter** = <value>. Reconsider the requested tolerance and/or the maximum number of iterations.

### NE\_PROBABILITY

The probability is too small to calculate accurately.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 6 Further Comments

The rate of convergence of the series depends, in part, on the quantity:  $t^2/(t^2 + \nu)$ . The smaller this quantity the faster the convergence. Thus for large  $t$  and small  $\nu$  the convergence may be slow. If  $\nu$  is an integer then one of the series to be summed is of finite length.

If two tail probabilities are required then the relationship of the  $t$ -distribution to the  $F$ -distribution can be used:

$$F = T^2, \lambda = \delta^2, \nu_1 = 1 \quad \text{and} \quad \nu_2 = \nu,$$

and a call made to nag\_prob\_non\_central\_f\_dist (g01gdc).

**Note:** this routine only allows degrees of freedom greater than or equal to 1 although values between 0 and 1 are theoretically possible.

### 6.1 Accuracy

The series described in Amos (1964) are summed until an estimated upper bound on the contribution of future terms to the probability is less than **tol**. There may also be some slight loss of accuracy due to calculation of gamma functions. For large values of  $\delta > 50$  there may be significant loss of accuracy.

## 8 Example

Values from, and degrees of freedom for and non-centrality parameter of the non-central Student's  $t$ -distributions are read, the lower tail probabilities calculated and all these values printed until the end of data is reached.

### 8.1 Program Text

```
/* nag_prob_non_central_students_t (g01gbc) Example Program.
