NAG C Library Function Document

nag_rngs_von_mises (g05lpc)

1 Purpose

nag_rngs_von_mises (g05lpc) generates a vector of pseudo-random numbers from a von Mises distribution with concentration parameter κ.

2 Specification

```
void nag_rngs_von_mises (double vk, Integer n, double x[], Integer igen,
     Integer iseed[], NagError *fail)
```

3 Description

The von Mises distribution is a symmetric distribution used in the analysis of circular data. The probability density function of this distribution on the circle with mean direction $\mu_0 = 0$ and concentration parameter kappa, κ, can be written as:

$$f(\theta) = \frac{e^{\kappa \cos \theta}}{2\pi I_0(\kappa)},$$

where θ is reduced modulo 2π so that $-\pi \leq \theta < \pi$ and $\kappa \geq 0$. For very small κ the distribution is almost the uniform distribution, whereas for $\kappa \rightarrow \infty$ all the probability is concentrated at one point.

The n variates, $\theta_1, \theta_2, \ldots, \theta_n$, are generated using an envelope rejection method with a wrapped Cauchy target distribution as proposed by Best and Fisher (1979) and described by Dagpunar (1988).

One of the initialisation functions nag_rngs_init_repeatable (g05kbc) (for a repeatable sequence if computed sequentially) or nag_rngs_init_nonrepeatable (g05kcc) (for a non-repeatable sequence) must be called prior to the first call to nag_rngs_von_mises (g05lpc).

5 Parameters

1: **vk** – double *Input*

On entry: the concentration parameter, κ, of the required von Mises distribution.

Constraint: **vk** > 0.0.

2: **n** – Integer *Input*

On entry: the number, n, of pseudo-random numbers to be generated.

Constraint: **n** ≥ 0.

3: **x**[dim] – double *Output*

Note: the dimension, dim, of the array **x** must be at least $\max(1, \mathbf{n})$.

On exit: the n pseudo-random numbers from the specified von Mises distribution.

4: **igen** – Integer *Input*

On entry: must contain the identification number for the generator to be used to return a pseudo-random number and should remain unchanged following initialisation by a prior call to one of the functions nag_rngs_init_repeatable (g05kbc) or nag_rngs_init_nonrepeatable (g05kcc).

5: **iseed**[4] – Integer *Input/Output*

On entry: contains values which define the current state of the selected generator.

On exit: contains updated values defining the new state of the selected generator.

6: **fail** – NagError * *Input/Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

NE_REAL

On entry, **vk** = ⟨*value*⟩.
Constraint: **vk** > 0.0.

NE_BAD_PARAM

On entry, parameter ⟨*value*⟩ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

Not applicable.

8 Further Comments

For a given number of random variates the generation time increases slightly with increasing κ.

9 Example

The example program prints the first five pseudo-random real numbers from a von Mises distribution with $\kappa = 1.0$, generated by a single call to nag_rngs_von_mises (g05lpc), after initialisation by nag_rngs_init_repeatable (g05kbc).
